

The diagram illustrates two return routes for a robot in a 3D environment. The environment consists of three layers: a top orange layer, a middle gray layer, and a bottom blue layer with horizontal ridges. A robot, represented by a small circle, is positioned on the middle gray layer. The robot's initial position is marked with a small circle and labeled 'O' in orange. The robot's goal is to return to its homebound, represented by a blue box labeled 'Cage' in blue. The robot's path is indicated by a thick purple arrow. The left side shows the 'West' return route, where the robot moves westward on the top orange layer, then down to the middle gray layer, and finally down to the bottom blue layer. The right side shows the 'North' return route, where the robot moves northward on the top orange layer, then down to the middle gray layer, and finally down to the bottom blue layer. The text 'Return route: ▽ Homebound' is written below the West route, and 'Return route: ▽ To O (cage)' is written below the North route. The text 'vs.' is placed between the two routes.
